

Digital Logic Levels

Definitions

- V_{CC} – positive power supply voltage
- $-V_{CC}$ – negative power supply voltage (usually 0V)
- V_{OH} – the voltage on the output pin when the value of the logical operation is a “1”
- V_{OL} – the voltage on the output pin when the value of the logical operation is a “0”
- V_{iH} – the minimum voltage on the input pin that causes the logical gate to operate like there is a “1” on the input.
- V_{iL} – the maximum voltage on an input pin that causes the logical gate to operate like there is a “0” on the input.
- X – the range of voltages on the input pins that result in a voltage on the output pin that can not be recognized as a “0” or a “1” on the input pin of another logical gate.
